Lab Week 9

Rosa Fallahpour

Question 1

Answer

Expected deaths is the implied number of lip cancer deaths for a particular region given that region's age structure and the national level age-specific mortality rates for lip cancer. For example, an expected number of deaths of 6 would mean that for particular region, we would expect 6 lip cancer deaths if this region were to experience the same age specific mortality rates as at the national level.

Question 2

Answer

$$y_i | \theta_i \sim Poisson(\theta_i.e_i)$$

We look at three models for $log\theta_i$ as below:

Model 1:

$$\log \theta_i = \alpha + \beta x_i$$

```
library(tidyverse)
library(rstan)
library(tidybayes)
library(here)
stan_data <- list(y = observe.i,
                  log_e = log(expect.i),
                  N = length(observe.i),
                  x = aff.i - mean(aff.i))
mod1 <- stan(data = stan_data, file = here("lip_cancer_mod1.stan"))
```

```
##
## SAMPLING FOR MODEL 'anon_model' NOW (CHAIN 1).
## Chain 1:
## Chain 1: Gradient evaluation took 3.1e-05 seconds
## Chain 1: 1000 transitions using 10 leapfrog steps per transition would take 0.31 seconds.
## Chain 1: Adjust your expectations accordingly!
## Chain 1:
## Chain 1:
## Chain 1: Iteration:    1 / 2000 [  0%]  (Warmup)

Question 3

Answer

Plots are shown below. The first graph represents the estimates of log theta for all three models. The second plot displays the log estimates for each region with corresponding error bars.

```
res_mod1 <- mod1 |> gather_draws(log_theta[i])|>median_qi()|> rename(median_mod1 = .value,lower_mod1 =

res_mod2 <- mod2 |> gather_draws(log_theta[i])|>median_qi()|> rename(median_mod2 = .value,lower_mod2 =

res_mod3 <- mod3 |> gather_draws(log_theta[i])|>median_qi()|> rename(median_mod3 = .value,lower_mod3 =

res <- res_mod1 |>
```

```
  left_join(res_mod2, by = "i") |>
  left_join(res_mod3, by = "i")
```

```
res |> dplyr::select (median_mod1,median_mod2,median_mod3) |> pivot_longer(median_mod1:median_mod3,name
```

```
res |>mutate(deaths=observe.i)|> mutate(log_smr=log(observe.i/expect.i))|>ggplot(aes(log_smr,median_mod
```
